Total Hysteroscopy System: Diagnostic and Operative Procedures with One Scope

The pioneering design of the TRUCLEAR™ 5C Hysteroscope Set lets you treat intrauterine abnormalities at the same time you diagnose them, eliminating the need for two separate scopes.

New, Patient-Friendly Instrumentation

- The TRUCLEAR™ 5C Hysteroscope Set offers patient-friendly instrumentation, with an oblique, anatomically-designed distal end for gentle introduction into the cervical canal and uterine cavity, requiring little or no dilation.

Small Operative Instrumentation

- Eliminates the need for scope changes, helping to reduce procedure time
- Enables access in high BMI patients with long working channel
- Facilitates gentle procedures compared to larger competitive products
- Can be used in the office or the OR
- Allows for removal and complete capture of tissue when coupled with the TRUCLEAR™ Tissue Removal Devices

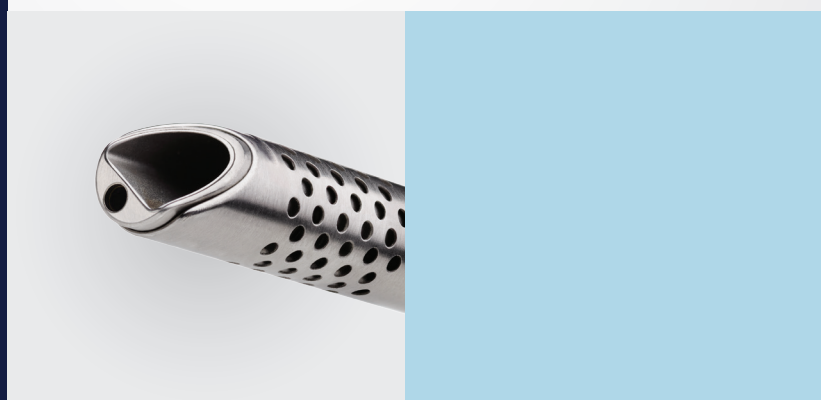

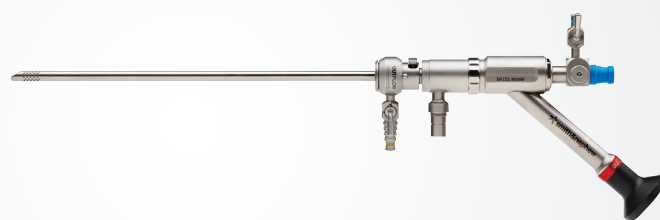

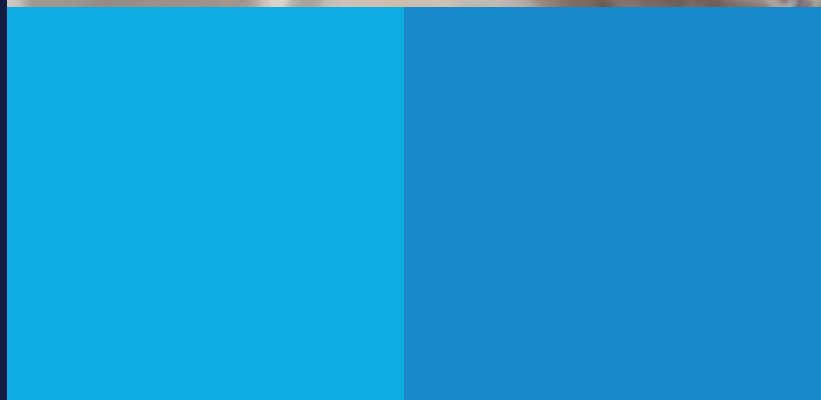

Clear Operative Field

- 100% continuous flow enhances visualization throughout procedure
- Optimized for use with the Hysteroscopic Fluid Management System

The Best Choice For Office Hysteroscopy

- New, patient-friendly hysteroscope builds upon the TRUCLEAR™ 5.0 System, which recent studies suggest may represent the best choice for office hysteroscopy¹

A Systematic Review Regarding Safety, Efficacy, Advantages and Contraindications". Reproductive Sciences, Published Online.

MAXIMIZE YOUR EFFICIENCY: **SEE-AND-TREAT.**

"The TRUCLEAR™ system further enhances the feasibility of convenient and efficient "see-and-treat" approaches to patient management."

– Prof. Justin Clark, MD

"The TRUCLEAR™ system overcomes one of the major hurdles in hysteroscopic polyp and fibroid removal, namely the safe extraction, under direct vision, of tissue specimens from the uterine cavity for histological assessment. Its small diameter, combined with its efficient, atraumatic mechanical action translates into short treatment times and a minimal surgical learning curve for those practitioners familiar with hysteroscopy. Research data support the use of the TRUCLEAR™ system in both the inpatient and office environment. Indeed our own randomised controlled trial showed that for the removal of endometrial polyps, the TRUCLEAR™ system is rapid, highly effective with a negligible failure rate and associated with both low pain scores and high rates of patient acceptability.

Strong evidence now supports the use of office based hysteroscopic surgery for common gynaecological conditions. The TRUCLEAR™ system further enhances the feasibility of convenient and efficient "see-and-treat" approaches to patient management. I am sure that mechanical hysteroscopic tissue removal will change the way we practise, expanding the adoption of office-based treatment and saving scarce health care resources by avoiding unnecessary hospital admission.

I would recommend that all clinicians develop efficient patient care pathways for the diagnosis and treatment of abnormal uterine bleeding, subfertility and uterine abnormalities utilising a "see-and-treat" policy where possible. I consider that the use of the TRUCLEAR™ system for the management of endometrial polyps, the commonest intrauterine pathology, integral to these contemporary developments."
